(COPACTOR: This protein belongs to the multicopper oxidases of the contain three distinct Cu centers known as type 1 or blue, contain three distinct Cu centers known as type 1 or blue, or normal, and type 3 or coupled binuclear (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DOMAIN: The methionine-rich domain could provide binding exogenous copper ions. This methionine-rich region is probimportant for copper tolerance in bacteria.

SIMILARITY: BELONGS TO THE FAMILY OF MULTICOPPER OXIDASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SIMILARITY: Contains 3 plastocyanin-like domains.

COPACTOR: BINDS 4 CU-IONS PER MOLECULE. THREE DISCOPACTOR: BINDS 4 CU-IONS PER MOLECULE. THREE DISCOPPACTOR: BINDCLEAR (BY SIMILARITY).

3 OR COUPLED BINUCLEAR (BY SIMILARITY).

SUBUNIT: Homodimer (By similarity).

SUBCELLULAR LOCATION: Secreted.

TISSUE SPECIFICITY: IN MYCELLA, AT A LOWER LEVEL SIMILARITY: BELONGS TO THE FAMILY OF MULTICOPPER SIMILARITY: Contains 3 plastocyanin-like domains.
                                                                                        FUNCTION: LIGNIN DEGRADATION AND DETOXIF PRODUCTS (PROBABLE).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Johnson P.E., Joshi M.D., Tomme P., Kilburn D.G., McIntosh L.P.;

"structure of the N-terminal cellulose-binding domain of Cellulomonas
fimi CenC determined by nuclear magnetic resonance spectroscopy.";

Biochemistry 35:14381-14394(1996).

-i- FUNCTION: THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE
GENERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENZYMES:

(1) ENDOGLUCANASES WHICH CUT INTERNAL BETA-1, 4-GLUCOSIDIC BONDS;

(2) EXOCELLOBIOHYDROLASES THAT CUT THE DISSACCHARIDE CELLOBIOSE
FROM THE NONREDUCING END OF THE CELLULOSE POLYMER CHAIN;

(3) BETA-1, 4-GLUCOSIDASES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER

(3) BETA-1, 4-GLUCOSIDASES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER

(3) SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.
                                                                                                                                                                                                                                                                                                                   Protein

FUNCTION: CERULOPLASMIN IS A BLUE, COPPER-BINDING (6-7 ATOMS PER MOLECULE) GLYCOPROTEIN FOUND IN PLASMA. FOUR POSSIBLE FUNCTIONS ARE FERROXIDASE ACTIVITY, ANIN COUPER TRANSPORT AND HOMEOSTASIS, AND SUPEROXIDE DISMUTASE ACTIVITY. COPPER TRANSPORT CATALYTIC ACTIVITY: 4 Fe(2+) + 4 H(+) + 0(2) = 4 Fe(3+) + 2 H(2)0. COPACTOR: BINDS 6 CU-IONS PER MOLECULE. THIS PROTEIN BELONGS TO THE MULTICOPPER OXIDASES: WHICH CONTAIN THREE DISTINCT CU CENTERS KNOWN AS TYPE 1 OR BLUE, TYPE 2 OR NORMAL, AND TYPE 3 OR COUPLED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              unusually low redox potential compared with mitochondrial cytochrome c. It is reactive with cytochrome c oxidases b
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SWISS-PROT entry

                                                                                                                                                                                                                                                                                                 links actin filaments to membrane glycoproteins. Anchors variransmembrane proteins to the actin cytoskeleton and serves scaffold for a wide range of cytoplasmic signaling proteins. SUBUNIT: Homodimer. Interacts with cvHsp. Interacts with varocher binding partners in addition to filamentous actin. SUBCELLULAR LOCATION: PERIPHERAL CYTOPLASM.
                          surface. In heterozygous females these neurons presumably represent those cells that, after X-chromosome inactivation, contain the active X chromosome with the filamin mutation. Most hemizygous affected males die early during embryogenesis, whereas heterozygous females have normal intelligence but suffer from seizures and various manifestations outside the central nervous system, especially related to the vascular system. This implies that essential embryonic cell migration can only occur in FLNA-
                                                                                                                                                                PTM: The N-terminus is blocked.

DISEASE: Defects in FLNA are the cause of periventricular heterotopia (PH) also called nodular heterotopia, bilateral periventricular (NHBP or BPNH). PH is an X-linked developmental dominant disorder in which many neurons fail to migrate into the cerebral cortex. They remain as nodules lining the ventricular

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ACTIN-BINDING PROTEINS (SUCH AS ACTININ, DYSTROPHIN, FIMBRIN, ABP-120, ABP-180, OR BETA-FODRIN).
SIMILARITY: Contains 2 calponin-homology (CH) domains.
SIMILARITY: Contains 24 filamin repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             IPR001298; Filamin.

mbrane protein B precursor (168 kDa surface-layer protein)
protein antigen) (Cell surface antigen 5) (Sca5) (rOmpB)
[Contains: 120 kDa surface-exposed protein (Surface protein (120 kDa outer membrane protein ompB); 32 kDa beta peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CYVTEID---QDKYAVRFIP-----RENGVYLIDVKFNGT--HIPG-SPFKIRVGEP

                                                     PATHWAY: Nitrate assimilation (denitrification).
SUBUNIT: Homotrimer (By similarity).
SUBCELULIAR LOCATION: Periplasmic (By similarity).
DOMAIN: THE TYPE I COPPER SITE IN NIR PLAYS A CRUCIAL ROLE FOR ELECTRON TRANSFER FROM PSEUDOAZURIN TO THE TYPE II COPPER SITE OF NIR, WHICH COMPRISES THE CATALYTIC CENTER OF NIR FOR THE REDUCTION OF NITRITE.
                                            SIMILARITY: Contains 2 plastocyanin-like domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               137 MPHNVDFHAATG 148
